# 1 Introduction

## 1.1 State of the art survey

To assess the present state of streaming sites and their attractiveness to consumers, we ran a survey to gather information on the most popular streaming platforms, the reasons for their appeal over competitors, and their disadvantages over others.

We discovered that Netflix is one of the most popular streaming sites after reviewing all of the poll responses. The appeal of Netflix as a more preferable option was due to its ease of use, appealing user interface, and categorical specification of the streaming content. Even with these advantages, however, the number of Netflix users was very low. The cause could be attributed to the subscription service's high cost. Other streaming services were also unsatisfactory.

So, to address the need for a streaming site with a user-friendly, appealing, and simple-to-use interface, we've chosen to create a streaming web platform with all of Netflix's features at a far lower cost. Our proposed solution, "NOT-FLIX" (website name), offers its users the best streaming video experience available without putting a strain on their wallet.

## 1.2 Intended Audience and Reading Suggestions

This SRS is for developers, project managers, users and testers. Further the discussion will provide all the internal, external, functional and also non-functional informations about "NOT-Flix WEBSITE".

## 1.3 Project Scope

"NOT-Flix WEBSITE" is a online streaming platform which provides all feature and the user experience offered by NetFlix.

After getting signing up to a Not-Flix user is redirected to a subscription page..He/She will be added as a user to the database after completing his/her payment process. After that he/she is redirected to the homepage, where he/she can see all the suggestions of the content he/she would like to watch. User profile will contain all his personal informations, subscription details and notifications

## 2 Overall Description

### 2.1 Problem Statement

”NOT-Flix WEBSITE” is a online streaming website with User friendly Interface and implementations of similar features like NetFlix.

### 2.2 Objectives

The following are the Objectives of our project:

- User friendly Site with less expenses.
- Categorical classification of the content.
- System for real-time search.

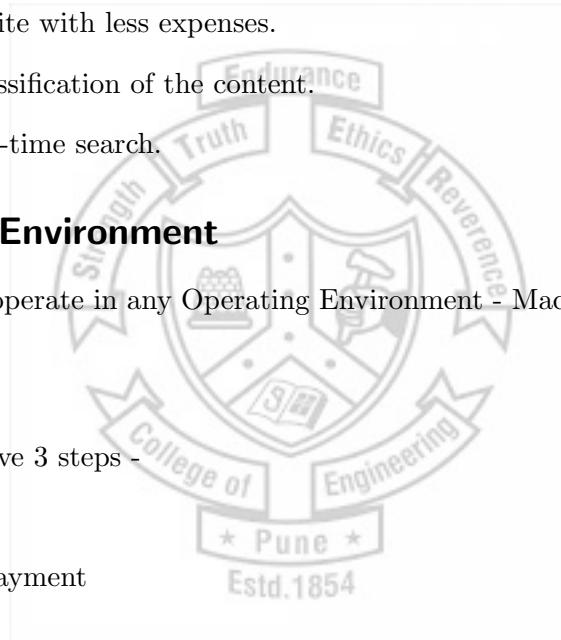

### 2.3 Operating Environment

The website will be operate in any Operating Environment - Mac, Windows, Linux etc.

### 2.4 Design

Student activities have 3 steps -

- Sign Up
- Subscription Payment
- User Profile
- Streaming Content

# **3 Constraint**

## **3.1 Constraints for the project**

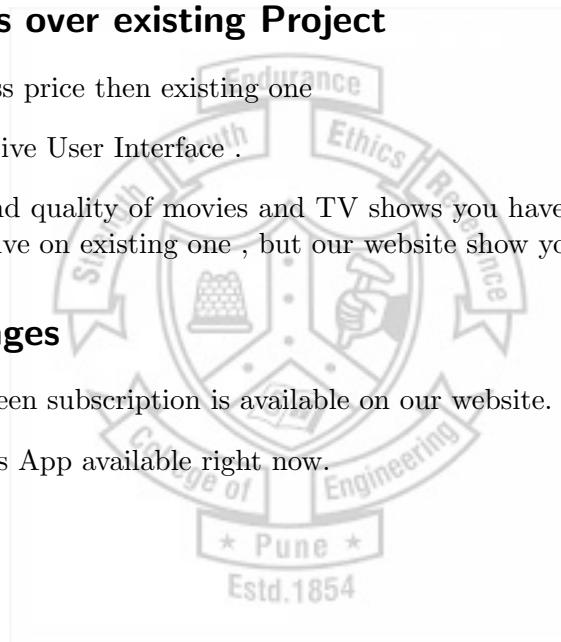

- Due to limited memory availability not able to show all the movies and shows on the website.
- Due to less budget not able to purchase all new movies which are recently released.
- Only single screen is available on a single email id .

## **3.2 Advantages over existing Project**

- Available at less price then existing one
- Provide attractive User Interface .
- The number and quality of movies and TV shows you have access to will depend on where you live on existing one , but our website show you all the content.

## **3.3 Disadvantages**

- Only single screen subscription is available on our website.
- No Android/Ios App available right now.

## 4 System Features

”NOT-Flix WEBSITE” is an online streaming website. So the main art of this product is to watch content and provide a good user experience while using it.

### 4.1 Description and Priority

”NOT-Flix WEBSITE” has features that are main and also some are sub. But all the feature is necessary for this software.

The features with priority up to down -

1. Streaming of Content : This is the goal feature of this software.
2. Ability to search content
3. Categorical classification of content
4. Preview and thumbnail at home page
5. Season wise classification of the shows

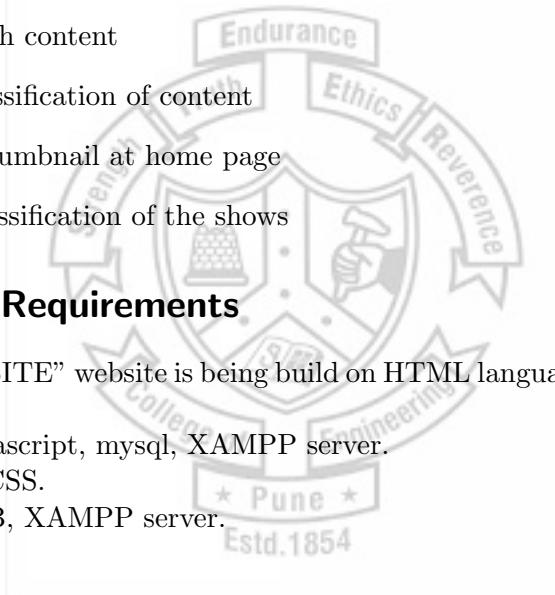

### 4.2 Functional Requirements

The ”Not-Flix WEBSITE” website is being build on HTML language, CSS, php, JavaScript and InnoDB.

Back-End - php, Javascript, mysql, XAMPP server.

Font-End - HTML, CSS.

Database - MongoDB, XAMPP server.

# 5 Other Nonfunctional Requirements

## 5.1 Performance Requirements

”NOT-Flix WEBSITE” is a website which provides a smooth user experience as same as NetFlix. It provides a cheap alternate to using Netflix.

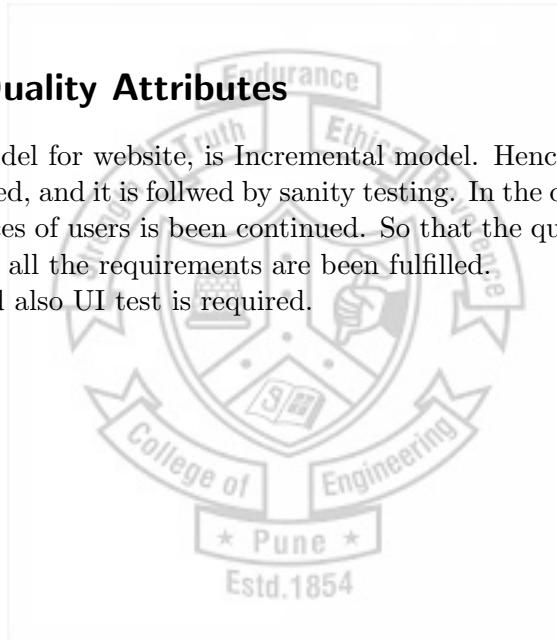

## 5.2 Security Requirements

No one without registered users can enter to the website. Protection against SQL injection attacks.

## 5.3 Software Quality Attributes

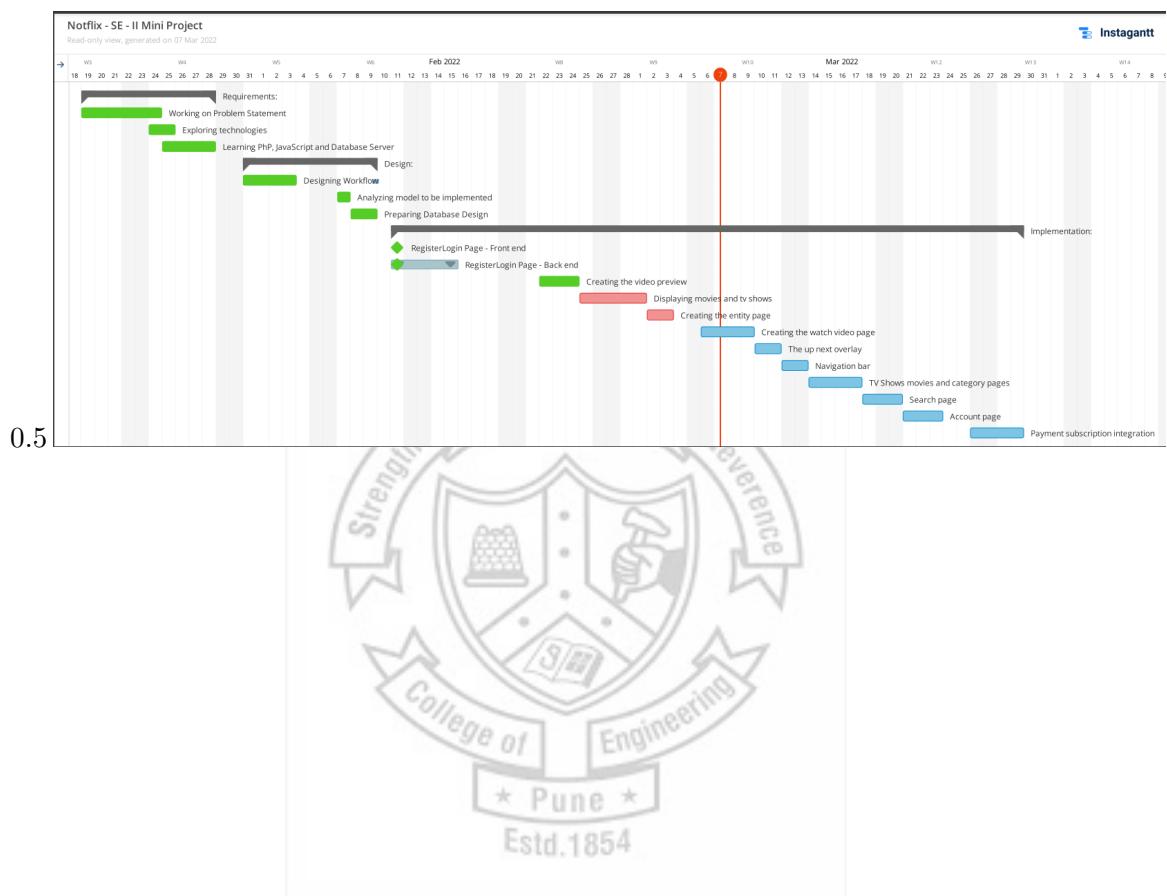

Our development model for website, is Incremental model. Hence, testing is done after each new feature added, and it is followed by sanity testing. In the development phase also testing and conferences of users is been continued. So that the quality of the software is been maintained and all the requirements are been fulfilled.

Database, logical and also UI test is required.

## 8 Code ScreenShots

The screenshot shows the Visual Studio Code interface with the following details:

- File Bar:** File, Edit, Selection, View, Go, Run, Terminal, Help.
- Title Bar:** Account.php - Netflix - Visual Studio Code.
- Explorer Panel:** Shows the project structure under 'NETFLIX'. The 'Account.php' file is selected in the 'classes' folder.
- Editor Panel:** Displays the PHP code for 'Account.php'. The code includes class definitions, constructor logic, and a method for updating user details. It uses prepared statements for database queries.
- Bottom Status Bar:** Lines 177, Column 39, Spaces: 4, UTF-8, LF, PHP, Go Live, 23:11, ENG, 10-04-2022.
- Taskbar:** Shows various open tabs and system icons.

The screenshot shows the Visual Studio Code interface with the following details:

- File Path:** includes > classes > Account.php
- Code Content (Excerpt):**

```
31     public function register($fn, $ln, $un, $em, $em2, $pw, $pw2) {
32         $this->validateFirstName($fn);
33         $this->validateLastName($ln);
34         $this->validateUserName($un);
35         $this->validateEmails($em, $em2);
36         $this->validatePasswords($pw, $pw2);
37
38         if(empty($this->errorArray)) {
39             return $this->insertUserDetails($fn, $ln, $un, $em, $pw);
40         }
41
42         return false;
43     }
44
45     public function login($un, $pw) {

- Bottom Status Bar:** Lines 58, Col 6, Spaces: 4, UTF-8, LF, PHP, Go Live, and a timestamp of 23:12 on 10-04-2022.

This screenshot shows the Visual Studio Code interface with the file `CategoryContainers.php` open. The code is a PHP script containing several functions related to movie categories. The `includes > classes >` path is shown in the breadcrumb bar. The code includes database queries using PDO and HTML generation for category lists.

```
public function showMoviesCategories() {
    $query = $this->con->prepare("SELECT * FROM categories");
    $query->execute();

    $html = "<div class='previewCategories'>
        <h1>Movies</h1>

        while($row = $query->fetch(PDO::FETCH_ASSOC)) {
            $html .= $this->getCategoryHtml($row, null, false, true);
        }

        return $html . "</div>";
}

public function showCategory($categoryId, $title = null) {
    $query = $this->con->prepare("SELECT * FROM categories WHERE id=:id");
    $query->bindValue(":id", $categoryId);
    $query->execute();

    $html = "<div class='previewCategories noScroll'>
        while($row = $query->fetch(PDO::FETCH_ASSOC)) {
            $html .= $this->getCategoryHtml($row, $title, true, true);
        }

        return $html . "</div>";
}

private function getCategoryHtml($sqlData, $title, $tvShows, $movies) {
```

This screenshot shows the Visual Studio Code interface with the file `CategoryContainers.php` open. The code is a continuation of the previous snippet, focusing on generating HTML for categories based on entity types (tv shows or movies). It uses `EntityProvider::getEntities` and `EntityProvider::getTVShowEntities` methods to fetch data and then creates preview squares for each entity.

```
private function getCategoryHtml($sqlData, $title, $tvShows, $movies) {
    $categoryId = $sqlData["id"];
    $title = $title == null ? $sqlData["name"] : $title;

    if($tvShows && $movies) {
        $entities = EntityProvider::getEntities($this->con, $categoryId, 30);
    }
    else if($tvShows) {
        // Get tv show entities
        $entities = EntityProvider::getTVShowEntities($this->con, $categoryId, 30);
    }
    else {
        // Get movie entities
        $entities = EntityProvider::getMoviesEntities($this->con, $categoryId, 30);
    }

    if(sizeof($entities) == 0) {
        return;
    }

    $entitiesHtml = "";
    $previewProvider = new PreviewProvider($this->con, $this->userName);
    foreach($entities as $entity) {
        $entitiesHtml .= $previewProvider->createEntityPreviewSquare($entity);
    }

    return "<div class='category'>
        <a href='category.php?id=$categoryId'>
            <h3>$title</h3>
        </a>
    </div>";
}
```

The screenshot shows the Visual Studio Code interface with the Constants.php file open in the editor. The file contains static class variables for validation messages. The code is as follows:

```
<?php  
class Constants {  
    public static $firstNameCharacters = "Your first name must be between 2 and 25 characters";  
    public static $lastNameCharacters = "Your last name must be between 2 and 25 characters";  
    public static $userNameCharacters = "Your userName must be between 2 and 25 characters";  
    public static $userNameTaken = "userName already in use";  
    public static $emailsDontMatch = "Your emails don't match";  
    public static $emailInvalid = "Invalid email";  
    public static $emailTaken = "Email already in use";  
    public static $passwordsDontMatch = "Passwords don't match";  
    public static $passwordLength = "Your password must be between 5 and 25 characters";  
    public static $loginFailed = "Your userName or password was incorrect";  
    public static $passwordIncorrect = "Your old password is incorrect";  
}  
?>
```

The screenshot shows the Visual Studio Code interface with the Entity.php file open in the editor. The file defines a class Entity with methods for constructing from input and retrieving entity data from a database. The code is as follows:

```
<?php  
class Entity {  
    private $con, $sqlData;  
  
    public function __construct($con, $input) {  
        $this->con = $con;  
  
        if(is_array($input)) {  
            $this->sqlData = $input;  
        }  
        else {  
            $query = $this->con->prepare("SELECT * FROM entities WHERE id=:id");  
            $query->bindValue(":id", $input);  
            $query->execute();  
  
            $this->sqlData = $query->fetch(PDO::FETCH_ASSOC);  
        }  
    }  
  
    public function getId() {  
        return $this->sqlData["id"];  
    }  
  
    public function getName() {  
        return $this->sqlData["name"];  
    }  
  
    public function getThumbnail() {  
        return $this->sqlData["thumbnail"];  
    }  
}
```

The screenshot shows the Visual Studio Code interface with the following details:

- File Explorer:** Shows the project structure under the **NETFLIX** folder, including **includes > classes** which contains **Entity.php**.
- Editor:** The **Entity.php** file is open, displaying PHP code for managing seasons and videos.
- Status Bar:** Shows the current file is **Entity.php - Netflix - Visual Studio Code**, with line 4, column 28, spaces: 4, and encoding: UTF-8.
- Bottom Bar:** Includes icons for Live Share, Taskbar, and system notifications.

```
public function getSeasons() {
    $query = $this->con->prepare("SELECT * FROM videos WHERE entityId=0
        AND isMovie=0 ORDER BY season, episode ASC");
    $query->bindValue(":id", $this->getId());
    $query->execute();

    $seasons = array();
    $videos = array();
    $currentSeason = null;
    while($row = $query->fetch(PDO::FETCH_ASSOC)) {
        if($currentSeason != null && $currentSeason != $row["season"]) {
            $seasons[] = new Season($currentSeason, $videos);
            $videos = array();
        }

        $currentSeason = $row["season"];
        $videos[] = new Video($this->con, $row);
    }

    if(sizeof($videos) != 0) {
        $seasons[] = new Season($currentSeason, $videos);
    }
}

return $seasons;
}
```

The screenshot shows the Visual Studio Code interface with the following details:

- File Explorer:** Shows the project structure under the **NETFLIX** folder, including **includes > classes** which contains **EntityProvider.php**.
- Editor:** The **EntityProvider.php** file is open, displaying PHP code for retrieving entities based on category ID.
- Status Bar:** Shows the current file is **EntityProvider.php - Netflix - Visual Studio Code**, with line 11, column 1, spaces: 4, and encoding: UTF-8.
- Bottom Bar:** Includes icons for Live Share, Taskbar, and system notifications.

```
<?php
class EntityProvider {

    public static function getEntities($con, $categoryId, $limit) {
        $sql = "SELECT * FROM entities ";

        if($categoryId != null) {
            $sql .= "WHERE categoryId=:categoryId ";
        }

        $sql .= "ORDER BY RAND() LIMIT :limit";

        $query = $con->prepare($sql);

        if($categoryId != null) {
            $query->bindValue(":categoryId", $categoryId);
        }

        $query->bindValue(":limit", $limit, PDO::PARAM_INT);
        $query->execute();

        $result = array();
        while($row = $query->fetch(PDO::FETCH_ASSOC)) {
            $result[] = new Entity($con, $row);
        }

        return $result;
    }
}
```

The screenshot shows the Visual Studio Code interface with the file `EntityProvider.php` open. The code implements a static function `getTVShowEntities` that performs a database query to fetch entities from the `entities` table, joining the `videos` table to filter movies. It includes logic for handling a category ID and ordering the results randomly with a limit.

```
public static function getTVShowEntities($con, $categoryId, $limit) {
    $sql = "SELECT DISTINCT(entities.id) FROM entities
        INNER JOIN videos ON entities.id = videos.entityId
        WHERE videos.isMovie = 0 ";

    if($categoryId != null) {
        $sql .= " AND categoryId=:categoryId ";
    }

    $sql .= " ORDER BY RAND() LIMIT :limit";

    $query = $con->prepare($sql);

    if($categoryId != null) {
        $query->bindValue(":categoryId", $categoryId);
    }

    $query->bindValue(":limit", $limit, PDO::PARAM_INT);
    $query->execute();

    $result = array();
    while($row = $query->fetch(PDO::FETCH_ASSOC)) {
        $result[] = new Entity($con, $row["id"]);
    }

    return $result;
}
```

The screenshot shows the Visual Studio Code interface with the file `FormSanitizer.php` open. This class contains static methods for sanitizing different types of input strings, such as removing tags, replacing whitespace, and normalizing case.

```
<?php
class FormSanitizer {

    public static function sanitizeFormString($inputText) {
        $inputText = strip_tags($inputText);
        $inputText = str_replace(' ', '', $inputText);
        $inputText = trim($inputText);
        $inputText = strtolower($inputText);
        $inputText = ucfirst($inputText);
        return $inputText;
    }

    public static function sanitizeFormUserName($inputText) {
        $inputText = strip_tags($inputText);
        $inputText = str_replace(' ', '', $inputText);
        return $inputText;
    }

    public static function sanitizeFormPassword($inputText) {
        $inputText = strip_tags($inputText);
        return $inputText;
    }

    public static function sanitizeFormEmail($inputText) {
        $inputText = strip_tags($inputText);
        $inputText = str_replace(' ', '', $inputText);
        return $inputText;
    }
}
```

The screenshot shows the Visual Studio Code interface with the following details:

- File Path:** PreviewProvider.php - Netflix - Visual Studio Code
- Explorer:** Shows the project structure under the NETFLIX folder, including classes like Account.php, CategoryContainer.php, Constants.php, Entity.php, EntityProvider.php, ErrorMessage.php, FormSanitizer.php, PreviewProvider.php, SearchResultsProvider.php, Season.php, SeasonProvider.php, User.php, and Video.php.
- Editor:** Displays the PHP code for PreviewProvider.php. The code includes methods for creating preview videos for TV shows and movies, as well as a category preview video.
- Status Bar:** Shows the current line (Ln 8, Col 37), spaces (Spaces: 4), encoding (UTF-8), line endings (LF), PHP, and Go Live status.

The screenshot shows the Visual Studio Code interface with the following details:

- File Path:** PreviewProvider.php - Netflix - Visual Studio Code
- Explorer:** Shows the project structure under the NETFLIX folder, including classes like Account.php, CategoryContainer.php, Constants.php, Entity.php, EntityProvider.php, ErrorMessage.php, FormSanitizer.php, PreviewProvider.php, SearchResultsProvider.php, Season.php, SeasonProvider.php, User.php, and Video.php.
- Editor:** Displays the PHP code for PreviewProvider.php, specifically focusing on the createPreviewVideo() method and its implementation.
- Status Bar:** Shows the current line (Ln 35, Col 5), spaces (Spaces: 4), encoding (UTF-8), line endings (LF), PHP, and Go Live status.

The screenshot shows the Visual Studio Code interface with the following details:

- File Path:** includes > classes > PreviewProvider.php
- Code Content (PreviewProvider.php):**

```
61     return "<div class='previewContainer'>
62         <img src='$thumbnail' class='previewImage' hidden>
63
64         <video autoplay muted class='previewVideo' onended='previewEnded()'>
65             <source src='$preview' type='video/mp4'>
66         </video>
67
68         <div class='previewOverlay'>
69             <div class='mainDetails'>
70                 <h3>$name</h3>

16        return $this->videos;
17    }
18
19 }
20 ?>
```

## 9 Future Scope

Currently our project is constrained by Cost and Time factors in development. But in the future, with enough efforts it can be developed and more improved.

- 1. Desktop Application Software** Now, we have implemented our Streaming platform as Website. But in the future it can be ported in to as application software in Windows, Linux or Mac, etc.
- 2. Mobile Application** It can be developed into mobile application for more ease of usage.
- 3. More available Content** With enough resources we can provide our user more cheap content to watch with smooth user experience.

# 10 Conclusion

We learned quite a few new things through the project.

**Problem Identification and Analysis:** From the state of the art survey, we identified a need of a more user friendly cheap alternative to OTT platforms. We attempted to recreate a more popular site with less cost.

**Knowledge of Software Development Techniques:** We discovered and learned various SDLC (Software Development Life Cycle) and Testing models.

**Collaboration:** We learned to collaborate between two developers working on same project

**Project Planning and Workflow:** We learned how to planned a project beforehand and follow accordingly with selected model.

**Project Documentation:** We created Gantt diagrams and Workflow diagrams for suitable planning of the project. We developed UML diagrams for suitable maintaince of the project.

**Project Completion within Deadline:** We successfully created a complete Online Streaming Site.
